

13. Exercise: Nonmonotonic functions

Exercise: Nonmonotonic functions

4/4 points (graded)

Suppose that \mathbf{X} is a continuous random variable and that $\mathbf{Y} = \mathbf{X}^4$. Then, for $y \geq 0$, we have

$$f_Y(y) = ay^b f_X(-cy^d) + ay^b f_X(cy^d),$$

for some a, b, d , and some $c > 0$. Find a, b, c , and d .

$a =$	<input type="text" value="1/4"/>	✓ Answer: 0.25
$b =$	<input type="text" value="-3/4"/>	✓ Answer: -0.75
$c =$	<input type="text" value="1"/>	✓ Answer: 1
$d =$	<input type="text" value="1/4"/>	✓ Answer: 0.25

Solution:

We have, for $y \geq 0$,

$$F_Y(y) = \mathbf{P}(Y \leq y) = \mathbf{P}(X^4 \leq y) = \mathbf{P}(-y^{1/4} \leq X \leq y^{1/4}) = F_X(y^{1/4}) - F_X(-y^{1/4}).$$

By differentiating, and using also the chain rule, we obtain

$$f_Y(y) = f_X(y^{1/4}) \cdot \frac{1}{4} \cdot y^{-3/4} + f_X(-y^{1/4}) \cdot \frac{1}{4} \cdot y^{-3/4}.$$

Therefore, $a = 1/4$, $b = -3/4$, $c = 1$, and $d = 1/4$.
