

### 3. Checking the Markov property

#### Problem 3. Checking the Markov property

7/7 points (ungraded)

For each one of the following definitions of the state  $X_k$  at time  $k$  (for  $k = 1, 2, \dots$ ), determine whether the Markov property is satisfied by the sequence  $X_1, X_2, \dots$

1. A fair six-sided die (with sides labelled  $1, 2, \dots, 6$ ) is rolled repeatedly and independently.

(a) Let  $X_k$  denote the largest number obtained in the first  $k$  rolls. Does the sequence  $X_1, X_2, \dots$  satisfy the Markov property?

Yes   Answer: Yes

(b) Let  $X_k$  denote the number of 6's obtained in the first  $k$  rolls, up to a maximum of ten. (That is, if ten or more 6's are obtained in the first  $k$  rolls, then  $X_k = 10$ .) Does the sequence  $X_1, X_2, \dots$  satisfy the Markov property?

Yes   Answer: Yes

(c) Let  $Y_k$  denote the result of the  $k^{\text{th}}$  roll. Let  $X_1 = Y_1$ , and for  $k \geq 2$ , let  $X_k = Y_k + Y_{k-1}$ . Does the sequence  $X_1, X_2, \dots$  satisfy the Markov property?

No   Answer: No

(d) Let  $Y_k = 1$  if the  $k^{\text{th}}$  roll results in an odd number; and  $Y_k = 0$  otherwise. Let  $X_1 = Y_1$ , and for  $k \geq 2$ , let  $X_k = Y_k \cdot X_{k-1}$ . Does the sequence  $X_1, X_2, \dots$  satisfy the Markov property?

Yes   Answer: Yes

2. Let  $Y_k$  be the state of some Markov chain at time  $k$  (i.e., it is known that the sequence  $Y_1, Y_2, \dots$  satisfies the Markov property).

(a) For a fixed integer  $r > 0$ , let  $X_k = Y_{r+k}$ . Does the sequence  $X_1, X_2, \dots$  satisfy the Markov property?

Yes   Answer: Yes

(b) Let  $X_k = Y_{2k}$ . Does the sequence  $X_1, X_2, \dots$  satisfy the Markov property?

Yes   Answer: Yes

(c) Let  $X_k = (Y_k, Y_{k+1})$ . Does the sequence  $X_1, X_2, \dots$  satisfy the Markov property?

Yes   Answer: Yes

#### Solution:

1. (a) Since the state  $X_k$  is the largest number obtained in  $k$  rolls, the set of states is  $S = \{1, 2, 3, 4, 5, 6\}$ . Given the largest number obtained in the first  $k$  rolls, the probability distribution of the largest number obtained in the first  $k + 1$  rolls no longer depends on what the largest number obtained was in the first  $k - 1$  rolls (or in the first  $k - 2$  rolls, etc.). Therefore the Markov property is satisfied.

For  $i, j \in \{1, 2, 3, 4, 5, 6\}$ , the transition probabilities are

$$p_{ij} = \begin{cases} 0, & \text{if } j < i, \\ \frac{i}{6}, & \text{if } j = i, \\ \frac{1}{6}, & \text{if } j > i. \end{cases}$$

(b) Since the state  $\mathbf{X}_k$  is the number of  $\mathbf{6}$ 's in the first  $k$  rolls, the set of states is  $\mathcal{S} = \{0, 1, 2, \dots, 10\}$ . The probability of getting a  $\mathbf{6}$  in a given trial is  $1/6$ . Given the number of  $\mathbf{6}$ 's in the first  $k$  rolls, the probability distribution of the number of  $\mathbf{6}$ 's in the first  $k + 1$  rolls no longer depends on the number of  $\mathbf{6}$ 's in the first  $k - 1$  rolls (or in the first  $k - 2$  rolls, etc.). Therefore the Markov property is satisfied.

Thus,  $p_{10,10} = 1$ , and for  $i \leq 9$ , the transition probabilities are

$$p_{ij} = \begin{cases} \frac{1}{6}, & \text{if } j = i + 1, \\ \frac{5}{6}, & \text{if } j = i, \\ 0, & \text{otherwise.} \end{cases}$$

(c) We have

$$\begin{aligned} \mathbf{P}(X_3 = 2 \mid X_2 = 3, X_1 = 1) &= \mathbf{P}(Y_2 + Y_3 = 2 \mid Y_1 = 1, Y_2 = 2) \\ &= \mathbf{P}(Y_3 = 0 \mid Y_1 = 1, Y_2 = 2) \\ &= 0, \end{aligned}$$

but

$$\begin{aligned} \mathbf{P}(X_3 = 2 \mid X_2 = 3, X_1 = 2) &= \mathbf{P}(Y_2 + Y_3 = 2 \mid Y_1 = 2, Y_2 = 1) \\ &= \mathbf{P}(Y_3 = 1 \mid Y_1 = 2, Y_2 = 1) \\ &= \mathbf{P}(Y_3 = 1) \\ &= 1/6, \end{aligned}$$

and therefore the Markov property is violated.

(d) At each stage,  $\mathbf{Y}_k$  has equal probability of being  $\mathbf{0}$  or  $\mathbf{1}$ . Since  $\mathbf{X}_k = \mathbf{Y}_k \cdot \mathbf{X}_{k-1}$ , and we assume independent rolls, clearly  $\mathbf{X}_k$  depends only on the  $k^{\text{th}}$  roll and the value of  $\mathbf{X}_{k-1}$ . Therefore the Markov property is satisfied.

The transition probabilities are  $p_{00} = 1$ ,  $p_{01} = 0$ ,  $p_{10} = 1/2$ , and  $p_{11} = 1/2$ .

2. (a) For  $\mathbf{X}_k = \mathbf{Y}_{r+k}$ , and because the sequence  $\{\mathbf{Y}_k\}$  satisfies the Markov property,

$$\begin{aligned} &\mathbf{P}(X_{k+1} = j \mid X_k = i, X_{k-1} = i_{k-1}, \dots, X_1 = i_1) \\ &= \mathbf{P}(Y_{r+k+1} = j \mid Y_{r+k} = i, Y_{r+k-1} = i_{k-1}, \dots, Y_{r+1} = i_1) \\ &= \mathbf{P}(Y_{r+k+1} = j \mid Y_{r+k} = i) \\ &= \mathbf{P}(X_{k+1} = j \mid X_k = i) \end{aligned}$$

Thus, the sequence  $\{\mathbf{X}_k\}$  satisfies the Markov property.

(b) For  $\mathbf{X}_k = \mathbf{Y}_{2k}$ , and because the sequence  $\{\mathbf{Y}_k\}$  satisfies the Markov property,

$$\begin{aligned} &\mathbf{P}(X_{k+1} = j \mid X_k = i, X_{k-1} = i_{k-1}, \dots, X_1 = i_1) \\ &= \mathbf{P}(Y_{2k+2} = j \mid Y_{2k} = i, Y_{2k-2} = i_{k-1}, \dots, Y_2 = i_1) \\ &= \mathbf{P}(Y_{2k+2} = j \mid Y_{2k} = i) \\ &= \mathbf{P}(X_{k+1} = j \mid X_k = i) \end{aligned}$$

Thus,  $\mathbf{X}_k$  satisfies the Markov property. The transition probabilities  $p_{ij}$  are given by

$$\begin{aligned} p_{ij} &= \mathbf{P}(X_{k+1} = j \mid X_k = i) \\ &= \mathbf{P}(Y_{2k+2} = j \mid Y_{2k} = i) \\ &= r_{ij}^y(2), \end{aligned}$$

where  $r_{ij}^y(n)$  are the  $n$ -step transition probabilities of the Markov chain  $\{\mathbf{Y}_k\}$ .

(c) Note that

$$\mathbf{P}(X_{k+1} = (n, \ell) \mid X_1 = (i_1, i_2), X_2 = (i_2, i_3), \dots, X_k = (i_k, n))$$

$$\begin{aligned}
&= \mathbf{P}(Y_{k+1} = n, Y_{k+2} = \ell \mid Y_1 = i_1, Y_2 = i_2, Y_3 = i_3, \dots, Y_k = i_k, Y_{k+1} = n) \\
&= \mathbf{P}(Y_{k+2} = \ell \mid Y_1 = i_1, Y_2 = i_2, \dots, Y_k = i_k, Y_{k+1} = n) \\
&= \mathbf{P}(Y_{k+2} = \ell \mid Y_k = i_k, Y_{k+1} = n) \\
&= \mathbf{P}(Y_{k+1} = n, Y_{k+2} = \ell \mid Y_k = i_k, Y_{k+1} = n) \\
&= \mathbf{P}(X_{k+1} = (n, \ell) \mid X_k = (i_k, n)).
\end{aligned}$$

Therefore the Markov property is satisfied.

Letting  $i = (i_k, i_{k+1})$  and  $j = (n, \ell)$ , the transition probabilities  $p_{ij}$  are given by

$$p_{ij} = \mathbf{P}(X_{k+1} = (n, \ell) \mid X_k = (i_k, i_{k+1})) = \begin{cases} q_{n\ell}, & \text{if } i_{k+1} = n, \\ 0, & \text{if } i_{k+1} \neq n, \end{cases}$$

where  $q_{n\ell}$  are the transition probabilities associated with the Markov chain  $\{Y_k\}$ .
