

# Bernoulli distribution

In probability theory and statistics, the **Bernoulli distribution**, named after Swiss mathematician Jacob Bernoulli,<sup>[1]</sup> is the discrete probability distribution of a random variable which takes the value 1 with probability ***p*** and the value 0 with probability ***q*** = **1** − ***p***, that is, the probability distribution of any single experiment that asks a yes–no question; the question results in a boolean-valued outcome, a single bit of information whose value is success/yes/true/one with probability *p* and failure/no/false/zero with probability *q*. It can be used to represent a (possibly biased) coin toss where 1 and 0 would represent "heads" and "tails" (or vice versa), respectively, and *p* would be the probability of the coin landing on heads or tails, respectively. In particular, unfair coins would have ***p*** ≠ **1/2**.

The Bernoulli distribution is a special case of the binomial distribution where a single trial is conducted (so *n* would be 1 for such a binomial distribution). It is also a special case of the **two-point distribution**, for which the possible outcomes need not be 0 and 1.

## Properties of the Bernoulli distribution

If ***X*** is a random variable with this distribution, then:

$$\Pr(X = 1) = p = 1 - \Pr(X = 0) = 1 - q.$$

The probability mass function ***f*** of this distribution, over possible outcomes *k*, is

$$f(k;p) = \begin{cases} p & \text{if } k = 1, \text{ [2]} \\ q = 1 - p & \text{if } k = 0. \end{cases}$$

This can also be expressed as

$$f(k;p) = p^k(1 - p)^{1-k} \quad \text{for } k \in \{0,1\}$$

or as

$$f(k;p) = pk + (1 - p)(1 - k) \quad \text{for } k \in \{0,1\}.$$

The Bernoulli distribution is a special case of the binomial distribution with ***n*** = **1**.<sup>[3]</sup>

The kurtosis goes to infinity for high and low values of ***p***, but for ***p*** = **1/2** the two-point distributions including the Bernoulli distribution have a lower excess kurtosis than any other probability distribution, namely −2.

The Bernoulli distributions for **0** ≤ ***p*** ≤ **1** form an exponential family.

The maximum likelihood estimator of ***p*** based on a random sample is the sample mean.

## Mean

The expected value of a Bernoulli random variable ***X*** is

$$\mathbf{E}(X) = p$$

This is due to the fact that for a Bernoulli distributed random variable ***X*** with **Pr**(***X*** = **1**) = ***p*** and **Pr**(***X*** = **0**) = ***q*** we find

$$\mathbf{E}[X] = \Pr(X = 1) \cdot 1 + \Pr(X = 0) \cdot 0 = p \cdot 1 + q \cdot 0 = p. \text{ [2]}$$

## Variance

The variance of a Bernoulli distributed ***X*** is

$$\mathbf{Var}[X] = pq = p(1 - p)$$

We first find

	Bernoulli
Parameters	<span><span>     0 ≤<!-- ≤ --> p ≤<!-- ≤ --> 1   q = 1 −<!-- − --> p   {\displaystyle 0\leq p\leq 1 \qquad q=1-p}  </span></span>
Support	<span><span>    k ∈<!-- ∈ --> { 0 , 1 }   {\displaystyle k\in \{0,1\}}  </span></span>
pmf	<span><span>     {    q = 1 −<!-- − --> p    if  k = 0   p    if  k = 1     {\displaystyle {\begin{cases}q=1-p&amp;{\text {if }}k=0\\p&amp;{\text {if }}k=1\end{cases}}  </span></span>
CDF	<span><span>     {    0    if  k &lt; 0   1 −<!-- − --> p    if  0 ≤<!-- ≤ --> k &lt; 1   1    if  k ≥<!-- ≥ --> 1     {\displaystyle {\begin{cases}0&amp;{\text {if }}k&lt;0\\1-p&amp;{\text {if }}0\leq k&lt;1\\1&amp;{\text {if }}k\geq 1\end{cases}}  </span></span>
Mean	<span><span>    p   {\displaystyle p}  </span></span>
Median	<span><span>     {    0    if  p &lt; 1  /  2   [ 0 , 1 ]    if  p = 1  /  2   1    if  p &gt; 1  /  2     {\displaystyle {\begin{cases}0&amp;{\text {if }}p&lt;1/2\\[0,1]&amp;{\text {if }}p=1/2\\1&amp;{\text {if }}p&gt;1/2\end{cases}}  </span></span>
Mode	<span><span>     {    0    if  p &lt; 1  /  2   0 , 1    if  p = 1  /  2   1    if  p &gt; 1  /  2     {\displaystyle {\begin{cases}0&amp;{\text {if }}p&lt;1/2\\0,1&amp;{\text {if }}p=1/2\\1&amp;{\text {if }}p&gt;1/2\end{cases}}  </span></span>
Variance	<span><span>    p ( 1 −<!-- − --> p ) = p q   {\displaystyle p(1-p)=pq}  </span></span>
Skewness	<span><span>       1 −<!-- − --> 2 p    p q      {\displaystyle {\frac {1-2p}{\sqrt {pq}}}}  </span></span>
Ex. kurtosis	<span><span>       1 −<!-- − --> 6 p q    p q      {\displaystyle {\frac {1-6pq}{pq}}}  </span></span>
Entropy	<span><span>    −<!-- − --> q ln ⁡<!-- ⁡ --> q −<!-- − --> p ln ⁡<!-- ⁡ --> p   {\displaystyle -q\ln q-p\ln p}  </span></span>
MGF	<span><span>    q + p  e  t     {\displaystyle q+pe^{t}}  </span></span>
CF	<span><span>    q + p  e  i t     {\displaystyle q+pe^{it}}  </span></span>
PGF	<span><span>    q + p z   {\displaystyle q+pz}  </span></span>
Fisher information	<span><span>       1    p q      {\displaystyle {\frac {1}{pq}}}  </span></span>

$$\mathbf{E}[X^2] = \Pr(X = 1) \cdot 1^2 + \Pr(X = 0) \cdot 0^2 = p \cdot 1^2 + q \cdot 0^2 = p$$

From this follows

$$\mathbf{Var}[X] = \mathbf{E}[X^2] - \mathbf{E}[X]^2 = p - p^2 = p(1 - p) = pq^{[2]}$$

## Skewness

The skewness is  $\frac{q - p}{\sqrt{pq}} = \frac{1 - 2p}{\sqrt{pq}}$ . When we take the standardized Bernoulli distributed random variable  $\frac{X - \mathbf{E}[X]}{\sqrt{\mathbf{Var}[X]}}$  we find that this random variable attains  $\frac{q}{\sqrt{pq}}$  with probability *p* and attains  $-\frac{p}{\sqrt{pq}}$  with probability *q*. Thus we get

$$\begin{aligned} \gamma_1 &= \mathbf{E} \left[ \left( \frac{X - \mathbf{E}[X]}{\sqrt{\mathbf{Var}[X]}} \right)^3 \right] \\ &= p \cdot \left( \frac{q}{\sqrt{pq}} \right)^3 + q \cdot \left( -\frac{p}{\sqrt{pq}} \right)^3 \\ &= \frac{1}{\sqrt{pq}^3} (pq^3 - qp^3) \\ &= \frac{pq}{\sqrt{pq}^3} (q - p) \\ &= \frac{q - p}{\sqrt{pq}} \end{aligned}$$

## Related distributions

- If *X*<sub>1</sub>, ..., *X*<sub>*n*</sub> are independent, identically distributed (i.i.d.) random variables, all Bernoulli trials with success probability *p*, then their sum is distributed according to a binomial distribution with parameters *n* and *p*:

$$\sum_{k=1}^n X_k \sim \mathbf{B}(n, p) \text{ (binomial distribution)}.^{[2]}$$

The Bernoulli distribution is simply **B(1,*p*)**, also written as **Bernoulli(*p*)**.

- The categorical distribution is the generalization of the Bernoulli distribution for variables with any constant number of discrete values.
- The Beta distribution is the conjugate prior of the Bernoulli distribution.
- The geometric distribution models the number of independent and identical Bernoulli trials needed to get one success.
- If *Y* ∼ **Bernoulli** ( $\frac{1}{2}$ ), then **2*Y* − 1** has a Rademacher distribution.
