8. Exercise: CLT practice

Exercise: CLT practice

6/6 points (graded)

The random variables X_i are i.i.d. with mean 2 and standard deviation equal to 3. Assume that the X_i are nonnegative. Let $S_n=X_1+\cdots+X_n.$

Use the CLT to find good approximations to the following quantities. You may want to refer to the <u>normal table</u>. In parts (a) and (b), give answers with 4 decimal digits.

Normal Table

<u>Show</u>

b) We let N (a random variable) be the first value of n for which S_n exceeds 119.

c) What is the largest possible value of n for which we have $\mathbf{P}(S_n \leq 128) pprox 0.5$?

$$n = 64$$
 Answer: 64

Solution:

We will use Z_n to refer to the standardized random variable $(S_n-2n)/(3\sqrt{n})$.

a) We have

$$\mathbf{P}(S_{100} \leq 245) = \mathbf{P}\left(rac{S_{100} - 2 \cdot 100}{3 \cdot \sqrt{100}} \leq rac{245 - 2 \cdot 100}{3 \cdot \sqrt{100}}
ight) = \mathbf{P}(Z_n \leq 1.5) pprox 0.9332.$$

b) The event N>49 is the same as the event $S_{49}\leq 119$. Its probability is

$$\mathbf{P}(S_{49} \leq 119) = \mathbf{P}\left(rac{S_{49} - 2 \cdot 49}{3 \cdot \sqrt{49}} \leq rac{119 - 2 \cdot 49}{3 \cdot \sqrt{49}}
ight) = \mathbf{P}(Z_n \leq 1) pprox 0.8413.$$

c) We want n such that

$$0.5pprox \mathbf{P}(S_n\leq 128)=\mathbf{P}\left(rac{S_n-2n}{3\sqrt{n}}\leq rac{128-2n}{3\sqrt{n}}
ight)=\Phi\left(rac{128-2n}{3\sqrt{n}}
ight).$$

But since $0.5=\Phi(0)$, we must have $(128-2n)/(3\sqrt{n})=0$, so that n=128/2=64.

A faster way to see the answer is to note that since the normal is symmetric around its mean, the relation ${f P}(S_n \le 128) pprox 0.50$ tells us that 128 should be equal to the mean, 2n, of S_n .
