8. Q-value Iteration Q-value Iteration

and unectly yet 4s.

And that's exactly what you will do in your exercise

You will reformulate this algorithm

and get a new algorithm which is called Q value iterations.

But the idea -- exactly the same.

And we will use this algorithm in our discussion

about reinforcement learning next time.

Thank you.

The derivation of the Q-value iteration update rule from the equation above is similar to the derivation of the value iteration update rule.

First, recall the Bellman equations:

$$egin{array}{lcl} V^{st}\left(s
ight) &=& \displaystyle\max_{a}Q^{st}\left(s,a
ight) \ & \ Q^{st}\left(s,a
ight) &=& \displaystyle\sum_{s'}T\left(s,a,s'
ight)\left(R\left(s,a,s'
ight)+\gamma V^{st}\left(s'
ight)
ight). \end{array}$$

Plugging first equation into the second, we get:

$$Q^{st}\left(s,a
ight) \;\;\; \equiv \;\;\; \sum_{s'} T\left(s,a,s'
ight) \left(R\left(s,a,s'
ight) + \gamma \max_{a'} Q^{st}\left(s',a'
ight)
ight).$$

Now, let $Q_k^*(s,a)$ be the expected rewards from state s followed by action a, and then acting optimally for k steps afterwards. (Hence, $V_k^*(s) = \max_a Q_k^*(s,a)$.)

Q-value Iteration Update Rule

1/1 point (graded)

Referring to the equations above, what should the Q-value iteration update rule be?

$$egin{aligned} \mathbb{Q}_{k+1}^{*}\left(s,a
ight) &= \sum_{s'}T\left(s,a,s'
ight)\left(R\left(s,a,s'
ight) + \gamma ext{max}_{s'}Q_{k}^{*}\left(s',a
ight)
ight) \end{aligned}$$

$$igcup Q_{k+1}^{st}\left(s,a
ight) =\sum_{s^{\prime}}T\left(s,a,s^{\prime}
ight) \left(R\left(s,a,s^{\prime}
ight) +\gamma V^{st}\left(s^{\prime}
ight)
ight)$$

$$ullet \ Q_{k+1}^{st}\left(s,a
ight) = \sum_{s'} T\left(s,a,s'
ight) \left(R\left(s,a,s'
ight) + \gamma {
m max}_{a'} Q_k^{st}\left(s',a'
ight)
ight)$$

$$igcup Q_{k+1}^*\left(s,a
ight) = \sum_{s'} T\left(s,a,s'
ight) \left(R\left(s,a,s'
ight) + \gamma Q_k^*\left(s',a
ight)
ight)$$

Solution:

Q-value iteration would use the previous iteration of the Q-value on the right hand side of the equation

$$Q^{st}\left(s,a
ight) \; = \; \sum_{s'} T\left(s,a,s'
ight) \left(R\left(s,a,s'
ight) + \gamma \max_{a'} Q^{st}\left(s',a'
ight)
ight)$$

to update the Q value estimate of the current step. Hence, the Q value update for $k^{
m th}$ step would look like:

$$Q_{k+1}^{st}\left(s,a
ight)=\sum_{s^{\prime}}T\left(s,a,s^{\prime}
ight)\left(R\left(s,a,s^{\prime}
ight)+\gamma\mathrm{max}_{a^{\prime}}Q_{k}^{st}\left(s^{\prime},a^{\prime}
ight)
ight).$$
